

Australian changes to the U.S. / CA QuickBooks SDK 2.0

NOTE: You must read the following information before using the SDK 2.0 with QuickBooks 2003 Australia, New Zealand or Singapore edition.

The SDK 2.0 Canadian documentation (included in the US documentation) can be used with the Australian version of QuickBooks 2003, although a number of differences exist in the xml fields used between these versions. These differences are shown below by way of a comparison between the Canadian and Australian editions. Note that the Australian xml tag naming is the same as that of the UK.

The US and Canadian sample applications and qbxmL requests can also be used as guides to help you develop your application. However, note that the line `<?qbxmL version="2.0"?>` or `<?qbxmL version="CA2.0"?>` in your qbxmL files must be changed to `<?qbxmL version="OZ2.0"?>` to work with the Australian, New Zealand, and Singapore versions of QuickBooks.

To test an XML file using the XML Validator, the OZ must be taken out of the qbxmL version header.

Note that we are not supporting the QBFC.

Modifications

<i>AU QuickBooks Area > Field Name</i>	<i>From (CA XML Tag)</i>	<i>To (AU XML Tag)</i>
Customer/Supplier/Other Name - Address Details > Province/State	Province	County
Employee-Address Info tab > Tax No.	SIN	NiNumber
